

Recipe Nest

Online recipes are notoriously difficult to navigate. They either require a subscription to save the recipes permanently or recipe authors obscure their recipes in a very long story instead of clearly showing the recipe.

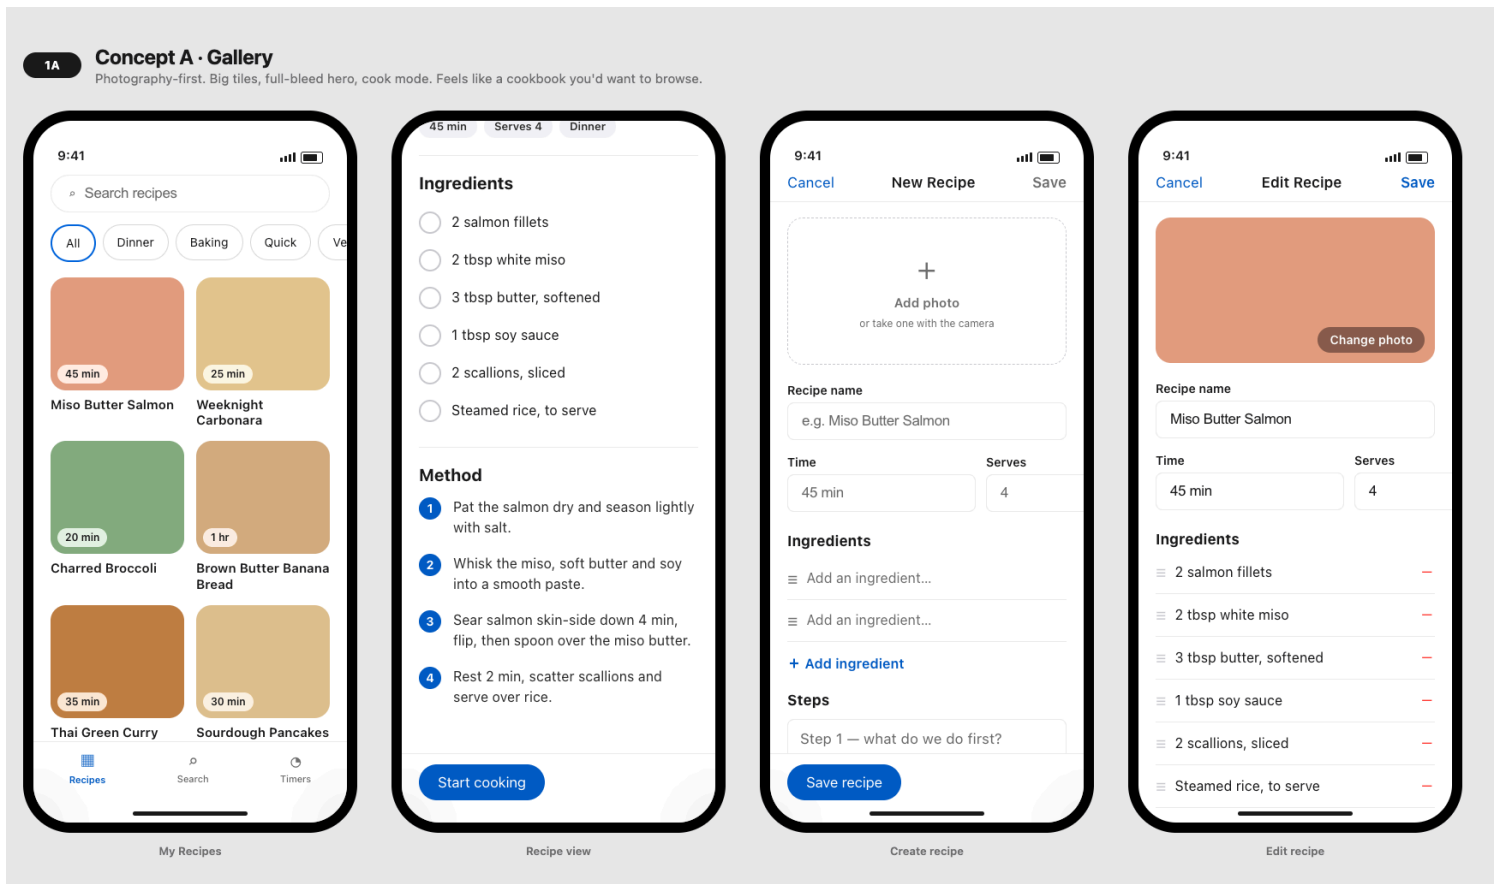

To solve this problem, we will create an IOS application called *Recipe Nest* that will allow users to quickly and easily catalogue recipes, without the subscription or fluff. Our team consists of: Mayowa Ayileka, Noah Sellers, and David Yang. This application will target home cooks who share this same problem of not being able to permanently save paywalled recipes from other authors and recipes being hard to get through.

Our minimum viable product will consist of implementing the basic functionality of the app. We'll need a home page to view all of the users' saved recipes, a recipe creation screen, and a recipe edit function. Catalogued recipes should persist between instances of the app, so they'll need data objects associated with them. After this core functionality is implemented we want to include the ability to categorize recipes into folders, touch gestures, like swipe to delete recipes, or swipe right to go back to the previous screen. We also plan to implement a timer feature that will use background services to continue while the app is out of focus.

Our team has also devised a few stretch goals, namely introducing a search and sort feature to the recipe catalogue, camera integration for quickly setting recipe thumbnail images, and a photo collage of previously cooked recipes.

Our team is dividing up the work based on each view so we all can work on our separate views and wire the views together once everyone finishes their view. Noah will work on the home page where all of the user's recipes are at. David will work on the view that will display the recipes and allow the user to edit it. Mayowa will complete the view for creating new recipes and adding it to the view. We will all work on wiring the views together.

View Gallery

In the *My Recipes* view the user can search or filter through their recipes, or view a collection of all recipes. The *Recipe view* will show how to cook a recipe. It will have information on what the dish looks like with an image, the ingredients needed, and the cooking steps. *Create Recipe* view will allow the user to add a new recipe to their collection. They can add a photo or take one and use it as the new recipe's thumbnail. Then they can specify the name, amount of time, servings, ingredients, and steps of the recipe. The *Edit Recipe* view allows the user to edit a recipe they have already created so they can edit the recipe thumbnail or any other information about the recipe.
